

Real time access to digital biomarkers in Clinical Trials

Reduce risks and accelerate implementation of automated and continuous data collection in your clinical trials using medical wearables with our plug-and-play technology bundle.

Opportunity: Wearable medical sensors enhance data collection in clinical trials by providing continuous, real-time, and objective health measurements, improving patient compliance, reducing site visits, and enabling more comprehensive and accurate analysis of treatment effects.

Challenge: The shift from controlled environments to the point of care in remote settings or at patients' homes lead to new operational challenges including participant compliance monitoring, assessment of data availability and quality as well as device fleet management and logistics.

Solution: Leitwert's Device+Hub and Clinical Trial App simplifies this process by streamlining setup, device management, and data collection. Research teams benefit from efficient workflows, reduced manual effort, and real-time visibility of data quality and patient compliance. This enables efficient evidence generation and Real-World Data collection in long-term clinical trials to develop new sensors, validate medical devices, develop conventional and digital treatments or capture objective outcome measures.

Benefit: Reduces risks and accelerates trial implementation for sponsors, saves investigators time, reduces dropouts and reduces the burden for trial participants.

Highlights:

- Convenient and simple for participants, efficient for researchers.
- Full access and control over data including raw sensor data.
- Automated real time data quality and availability assessments facilitate compliance monitoring.
- Our Unified Device Interface allows to integrate any third-party wearable through documented APIs.

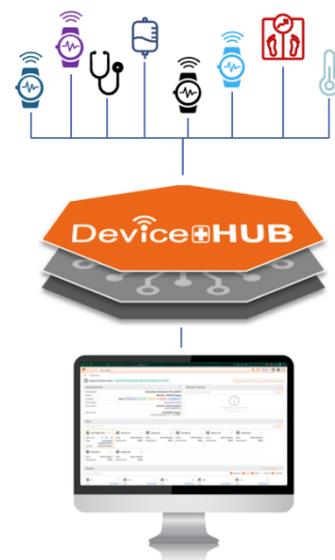

Trusted by world class research institutions and hospitals:

Leitwert AG, founded in 2014 at ETH Zurich, specialises in seamlessly integrating connected medical wearables into clinical processes and IT systems to exploit the potential of wearable sensors for the benefit of patients and hospitals. Our comprehensive IoMT-Device+Hub platform brings together portable (mobile) sensors and data-driven applications to improve the quality and efficiency of care through digitalisation.
